1. Executive Summary

TejoTime is a **multi-tenant queue + booking + CRM platform** for small service businesses (salons, barbershops, and similar). Each **store = one business tenant** with a public microsite, owner mobile app, and operational data stored in a shared backend.

Today: The admin panel handles store provisioning (create/edit microsites) and a basic *All Stores* list. It has **no analytics**.

Goal: Transform the admin panel into a **platform operations center** with platform-wide dashboard, enhanced store directory with live metrics, and per-store deep dive into customers, visits, bookings, and revenue trends.

All required data already exists in the database (customer, visit, appointment, queue_entry). New **admin-scoped API endpoints** are needed to expose it cross-tenant.

2. System Overview

2.1 Four Product Surfaces

Surface	Location	Purpose	User
Owner App	app/	Live queue, appointments, CRM	Store owner / staff
Public Microsite	frontend/	Online booking, join queue	End customers
Marketing Site	frontend/	Product funnel	Prospects
Admin Panel	admin-panel/	Store setup + analytics	Platform admin

2.2 System Architecture

2.3 Visit Lifecycle (Data Flow)

Checkout creates visit row and updates visits_count, total_spend_paise, last_visit_at
Admin analytics reads from visit + customer tables

Figure 2 — Visit lifecycle and analytics data source

3. Current Admin Panel State

3.1 Existing Pages

Route	Purpose	Status
/login	OTP authentication	Complete
/	Create store (full microsite form)	Complete
/stores	All stores table (name, category, phone, city)	Partial
/stores/[id]	Edit store form	Complete

3.2 Current Sidebar

3.3 Gaps

Gap	Impact
No analytics pages	Admin cannot see store performance
Stores table not clickable	No navigation to store detail or analytics
No platform dashboard	No cross-store bird's-eye view
Admin analytics APIs missing	Data exists but not exposed to admin panel
isActive not shown	Cannot see store status at a glance
No search / filter	Hard to manage many stores

4. Available Data & Metrics

4.1 Core Entities (Store = business)

Entity	Key fields	Analytics use
business	name, city, category, is_active, timezone	Store directory, filters
customer	visits_count, total_spend_paise, last_visit_at, is_vip	CRM, LTV, repeat rate
visit	amount_paise, service_name, staff_id, completed_at	Revenue, service/staff charts
appointment	status, source, scheduled_start_at	Bookings, no-shows, funnel
queue_entry	status, source, joined_at, completed_at	Live queue, walk-in vs online
subscription	plan (free / premium)	Plan column in store list

4.2 Metrics Matrix

Metric	How to compute	Where to show
Total customers	COUNT(customer) per business_id	Store overview, platform dashboard
Total revenue	SUM(visit.amount_paise)	Revenue charts, store table
Visits count	COUNT(visit)	Activity metrics
Avg ticket size	AVG(visit.amount_paise)	Store health KPI
Repeat customer rate	% where visits_count > 1	Customer insights
No-show rate	appointment.status = no_show	Bookings tab
Walk-in vs online	queue_entry.source / appointment.source	Pie chart
Top services	GROUP BY visit.service_name	Bar chart
Staff performance	GROUP BY visit.staff_id	Staff leaderboard
Live queue	queue_entry status IN (waiting, in_service)	Today KPI cards

Reference: Owner app already shows today's KPIs via GET /dashboard/summary (appointments, active queue, completed visits, revenue). Admin analytics should mirror this pattern with historical depth and cross-store scope.

5. Recommended Page Architecture

5.1 Three-Layer Information Architecture

5.2 Proposed Sidebar Navigation

6. Page Specifications

6.1 Platform Dashboard — /dashboard

Purpose: Bird's-eye view of the entire platform.

KPI Card	Metric
Total stores	Active / inactive split
Total customers	All tenants combined
Visits today	Platform-wide completed services
Revenue today	Sum of all visit amounts
Online bookings today	Appointments from microsite
Avg revenue per store	Platform health indicator

Charts: Revenue trend (30 days) · Stores by city/category · Top 5 stores by revenue · New stores this month

6.2 All Stores — /stores (enhanced)

Column	Source
Name	Link to store hub
Category / City	business fields
Status	isActive badge
Customers	COUNT(customer)
Visits (30d)	COUNT(visit) last 30 days
Revenue (30d)	SUM(visit.amount_paise)
Plan	subscription.plan
Last activity	MAX(visit.completed_at)
Actions	View analytics · Edit · Open microsite

Filters: Search by name/phone · City · Category · Plan · Active status

6.3 Store Hub — /stores/[id]

Sharp Cuts · Salon · Andheri West

+91 98765 43210 · tejotime.com/sharp-cuts

Overview

Customers

Visits

Bookings

Settings

[Active]

6.4 Overview Tab — KPIs & Charts

Section A — Today (live)

KPI	Description
Today's appointments	Booked for today
Active in queue	waiting + in_service
Completed today	visit count today
Revenue today	sum amount_paise today

Section B — All-time

KPI	Description
Total customers	CRM record count
Total visits	All completed services
Total revenue	Lifetime ₹
Avg ticket size	Revenue ÷ visits
Repeat customer rate	% with visits_count > 1
VIP count	is_vip customers

Section C — Charts

- Revenue over time (90 days, daily/weekly/monthly toggle)
- Visits over time
- Booking funnel (booked → checked-in → completed → no-show)
- Walk-in vs online (pie chart)
- Top 5 services by revenue or count
- Top staff by completions and revenue

7. Peak hours heatmap (day × hour)

Section D — Customer insights

- New vs returning customers (30d)
- Top 10 customers by spend
- Customers inactive 30+ days (at-risk count)
- Average visits per customer

6.5 Customers Tab

Table: Name, Phone, Visits, Total spend, Last visit, VIP, Notes. Search and filter by VIP, inactive, high spenders. Row click opens detail drawer with visit timeline.

6.6 Visits Tab

Financial ledger: Date, Customer, Service, Staff, Amount, Source. Date range filters. Summary bar: count, total revenue, avg ticket.

6.7 Bookings Tab

Calendar + list views. Metrics: conversion rate, no-show rate, online vs owner-created ratio, average lead time.

7. Navigation & UX Principles

- 1. **3-second rule** — Every page opens with 4–6 headline KPIs above the fold.
- 2. **Today → Trend → Detail** — Overview first; tables for drill-down.
- 3. **Same vocabulary as owner app** — Visits, Revenue, Appointments, Customers.
- 4. **Money in ₹** — Format paise consistently (₹1,840 or ₹18.4k).
- 5. **Status colors** — Green = active/completed, amber = waiting, red = no-show/cancelled.
- 6. **Period comparison** — Show "+12% vs last week" on KPI cards when deltas are available.
- 7. **Empty states** — Contextual messages when a store has no data yet.

8. Backend API Requirements

8.1 Existing Admin APIs

Method	Endpoint	Purpose
POST	/admin/auth/request-otp	OTP request
POST	/admin/auth/verify-otp	Login
GET	/admin/businesses	Store list
GET	/admin/businesses/:id	Store detail
POST	/admin/businesses	Create store
PUT	/admin/businesses/:id	Update store
GET	/admin/lookups	Category dropdown
POST	/admin/uploads/sign	Image upload

8.2 New APIs Needed

Endpoint	Purpose
GET /admin/analytics/overview	Platform dashboard KPIs + trends
GET /admin/businesses/:id/analytics?range=30d	Store overview + chart series
GET /admin/businesses/:id/customers	Paginated customer list
GET /admin/businesses/:id/customers/:cid/visits	Customer visit history
GET /admin/businesses/:id/visits?from=&to=	Visit ledger
GET /admin/businesses/:id/appointments	Bookings list / calendar

Note: Owner-scoped endpoints (/dashboard/summary, /customers) already exist but require owner JWT. Admin analytics needs cross-tenant routes with admin JWT.

9. Implementation Phases

Phase 1 — 1–2 weeks

Quick Wins

- Enhance /stores table with metrics columns and clickable rows
- Store overview tab with today + all-time KPIs
- Backend: GET /admin/businesses/:id/analytics (basic aggregates)

Phase 2 — 2–3 weeks

Deep Analytics

- Platform /dashboard with cross-store KPIs
- Revenue + visit trend charts per store
- Customer list page with search and filters
- Visit ledger page

Phase 3 — Later

Advanced

- Booking funnel, peak hours heatmap, customer segmentation
- CSV export for visits and customers
- Period comparison deltas (" +12% vs last week")
- daily_metric rollup table for performance at scale

10. UI Wireframes

10.1 Platform Dashboard

10.2 Store Overview

10.3 Admin User Journey

Drill-down path: platform view → store directory → store hub → tab-level detail

Figure 4 — Admin analytics user journey

11. Glossary

Term	Meaning
Business / Store	One tenant shop account in the platform
Visit	Completed service — the revenue event (creates amount_paise)
Queue entry	A person in the live queue (waiting or in service)
Appointment	A future booked time slot
Customer	CRM record with cached visit and spend totals
Paise	Money stored as integer (100 paise = ₹1)
Source	walk_in vs online — how the customer arrived
Plan	free vs premium subscription tier
